"Jurisdictional Questions Related to the General Direction, Management and Control of Animal Health,"

Abstract, Magyar Allatorvosok Lapja, Vol 18, No 2, Feb 63, pp 68-81.

Abstract: The author justifies a review of the delineation of the authority of the various animal health organs in view of the decentralization of animal health activities since 1953. This review is based on extensive quotes from pertinent sections of various government decrees which regulate animal health activities on the national and local level; the functions of veterinary government officers (hatosagi allatorvos) and those of the various veterinarians assigned to state or cooperative farms are defined. The article leaves no doubt that the author is critical of the present, decentralized system and would look toward increasing centralization for a remedy of current problems. There are no references.

"Some Current Problems of Animal Hygiene Administration. Part 3: Structure of the Animal Hygiene Administration."

Budapest, Magyar Allatorvosok Lapja, Vol 21, No 6, Jun 1966, pp 241-245.

Abstract: [Part 2 of this series was published Ibid., Vol 20, 1965, p 173] This article discusses the changes in animal hygiene administration occasioned by the socialist transformation of Hungarian agriculture. The structure of the animal hygiene administration, as it will emerge after the transition is complete, will depend on the correct decisions to be determined by the relevant authorities, on the way these decisions are implemented, on the way the implementation is supervised, and on the extent to which rational planning is employed in the operations involved. 37 references, including 2 German, 1 Western, 3 Russian, 1 Polish, and 30 Hungarian.

"Venography in the Pathological Processes of the Upper-Anterior Mediastinum."  
Budapest, Magyar Radiologia, Vol XIX, No 1, Feb 67, pages 6-15.

Abstract: [Authors' English summary modified] Filling the large veins with  
a contrast material is considered by the authors to be one of the most suit-  
able methods for the examination of pathological processes in the upper-  
anterior mediastinum. With the modern contrast media, this method is relative-  
ly harmless and, therefore, it is used increasingly in medical practice.  
The direct and indirect signs of expansive (space narrowing) processes are  
described and the possibilities of differential diagnosis are outlined. It  
is pointed out that, because of various factors, the severity of the clinical  
picture does not always correspond to that indicated by the roentgenogram.

"Responses of Energy Metabolism in the Newborn"

Budapest, Acta Physiologica Academiae Scientiarum Hungaricae, Supplement  
to Vol 22, 1963; p 19.

Abstract [Author's English summary, modified]: The newborn rat fails to maintain body temperature in an environment of 30°C, although heat production rises well above that observed at an ambient temperature of 35°C. Newborn rabbits fall into two groups: The great majority are capable of maintaining body temperature in an ambient temperature of 20°C already on the first day of life; a second group is incapable of doing so. Genetic differences appear to be the most plausible explanation.

"The Effect of Environmental Temperature, Hypoxia, and Hypercapnia on Total Heat Production and the Electrical Activity of Muscle in the Cold-Exposing and Non-Exposing Thermogenesis and the Site of Non-Exposing Heat Production."

Budapest, Acta Physiologica Academiae Scientiarum Hungaricae, Vol 23, No 1, 1963, pp. 49-52.

Abstract: [English article; authors' English summary] Continuous recording of the electrical activity of the back and thigh muscles, oxygen consumption, colonic and muscle temperatures in the adult, non cold-adapted rat during exposure to moderately cool ambient temperatures (19-21 degrees Centigrade) and to hypoxia at similar temperatures (13% oxygen) and hypercapnia (6% carbon dioxide) have demonstrated conclusively (a) the presence of non-exposing thermogenesis and

1/2

genesis in the non cold-adapted rat (a) the independence of changes in electrical activity and those in total heat production. Changes in colonic and rectal temperatures, in conjunction with changes in electrical activity of skeletal muscle, are interpreted to indicate (a) that muscle is not the primary source of cold-activating thermogenesis and (b) that an integrative regulation of energy metabolism, i.e., heat production, exists. TITLE: Investigations in the Field of the Synthesis of the  
Alkaloid Magnolamine (Issledovaniye v oblasti sinteza alkaloida  
Magnolamina).

PERIODICAL: Zhurnal Obshchey Khimii, 1957, Vol. 27, Nr 12,  
pp. 3353-3357 (USSR)

ABSTRACT: On the basis of the investigations conducted by the  
authors, the formula I was proposed for magnolamine in this  
paper. By a complete synthesis it was possible to establish  
the structure of this alkaloid definitively. In the present  
investigation it was succeeded to produce the basic inter-  
mediate product of the synthesis of the dimethylether of  
magnolamine. By means of a condensation of the dichlorine  
anhydride of the 3,4 - dimethoxy - 4,6 - dicarboxymethyl  
diphenylether (formula II) with - (3 - methoxy - 4 -  
benzyloxy) - phenylethylamine (formula III) the diamide  
was obtained (formula IV) the simultaneous closing of the  
two isoquinoline rings lead to the dichloric hydrate of the  
3,4 - dimethoxy - 4",6' - [ bi - (6 - methoxy - 7 - benzyl -

Magnolamine

oxi) - 3,4 dihydro - isoquinolyle] - dimethylphenylether (formula V). A further hydration, a methylation and a removal of the benzyl residua must lead to the dioxymethyl-ether of the magnolamine. The 3,4 - dimethoxy - 4',6 - dicarboxymethyldiphenylether (formula II) was produced by two methods. The further reaction process is represented by the formulae VI, VII, VIII, and IX. From this it appears, that a basic intermediate product of the synthesis of the dimethylether of the alkaloid magnolamine has been synthesized. There are 6 references, 2 of which are Slavic.

TITLE: The Synthesis of the Racemic Methyl Ether of o,o-Dibenzyl-  
magnolin (Sintez ratsemiceskogo metilovogo efira o,o-diben-  
zilmagnolina)

PERIODICAL: Zhurnal Obshchey Khimii, 1958, Vol.28, Nr 1, pp.167-169 (USSR)

ABSTRACT: The alkaloid magnolin (formula I,  $R = R' = H$ ) was liberated together with magnolamine (reference 1) from the leaves of the Caucasian magnolia (*Magnolia fusata* of the family Magnoliaceae), in the year 1938. The structure of magnolin was determined by the oxidation decomposition of its trimethylether (reference 2) ( $I, R = R' = \text{CH}_3$ ). On that occasion 1-keto-6,7-dimethoxy-2-methyltetrahydrcisoquinoline and 2-methoxy-5,4'-dicarboxydiphenylether were separated. The position of the free hydroxyl groups was determined by oxidation of the triethylether of the alkaloid. On the basis of these investigations the formula ( $I, R = R' = H$ ) was suggested for magnolin. The authors for their part realized the synthesis of the di-chlorohydrate of 2'-methoxy-5',4''-[bis-(6-methoxy-7-benzyl-

Card 1/2

**The Synthesis of the Racemic Methyl Ether of  $\alpha,\alpha$ -Dibenzylmagnolin**

oxy-2-methyl-1,2,3,4-tetrahydro)-isoquinolyl]-dimethyl-diphenyl-ether (II), which can after removal of the benzyl residue be converted to the (+) methylether of magnolin (I, R =H, R' =CH<sub>3</sub>). As initial product for the synthesis the author used the dichloroanhydride of 2-methoxy-5,4'-dicarboxymethyl-diphenyl-ether (III) and  $\beta$ -(3-methoxy-4-benzyloxy)-phenylamine (IV), where the diamide (V) is produced in the presence of potash. Under the influence of pentaphosphorus chloride the latter is converted to the bisdihydroisoquinoline derivative (VI) which is furthermore subjected to a catalytic hydrogenation and methylation by means of formaldehyde in the presence of formic acid. There are 3 references, all of which are Slavic.

TITLE:

Two Experiments in Vibratory Motion (Dva opyta po kolebatel'-nomu dvizheniyu)

PERIODICAL:

Fizika v shkole, 1958, Nr 5, pp 61-62 (USSR)

ABSTRACT:

Elastic oscillations can be well demonstrated with the aid of a vertical spring pendulum to obtain slowly dying oscillations with great periods ( $T = 2 - 3$  sec). However, the influence of the weight of the oscillating body makes it impossible to show the change in the elastic force with respect to time. The device excludes the influence of weight. This is accomplished by turning the dial of the demonstration dynamometer until the needle is at zero. For the other experiment a detailed explanation is given in the article.

There are 3 diagrams.
